

# SODAT software

---

## Case Study

### **Reference Problem:**

*"An employee **opened an attachment from an unknown email**. The antivirus didn't report any threat. Although, at the same time the virus uninstalled the protective software from the computer without user's acknowledgment. Subsequently the virus installed Crypt-Locker and as a result we lost all the data from that computer. Unfortunately, the virus encrypted approximately one-third of shared data on our network as well. However, with certain difficulties we were able to recover these data from our backups. Overall, we were quite happy that the incident occurred only on one computer and didn't destroy all the data on the network."*

**Client:** food company, more than 300 employees

### **SODAT software solutions:**

Using the OptimAccess technology we set restrictions on the .EXE and other executable files, which now protects the company as well as the individual users against these threats to which anti-virus doesn't react, and fails to protect the data directly.

**Used SODAT software technology:** OptimAccess
